Borrowing/Lending

The item record stores the number of times an item has circulated. Is it possible to tell how many of those circulations are local versus Prospector?

When a library lends an item through INN-Reach (where they have the real item record), Prospector check-outs do get counted. However, they are in the same counter field as local circulations and one cannot tell the difference.

Virtual items, on the other hand, have no counter in them as they are only temporary visitors to the local system.
