Non-III Libraries (DCB)

How is bibliographic and item data mapped into Prospector?

There are data elements in the item record that describe your collection and will need to be mapped into Prospector. These include collection codes, item codes, and status codes. Collection codes describe a particular type of collection such as Adult Literacy, or Current Periodicals. You can choose to contribute or not contribute a collection to Prospector. Item type codes are used to determine if a particular item is requestable or non-requestable in Prospector. Examples of Item types are Reference, Local History or Paperbacks. Status codes are used to determine if an item is available or not available for requesting through Prospector. For example, you probably want to map lost or missing items in your local catalog to a Non Available status in Prospector.
