Paging and Holds

Is there a way to determine where one is in the hold queue for a Prospector item?

INN-Reach, the underlying Prospector software, does not show the number of holds on a particular item or what position one is in the hold queue. It would be pretty difficult to do this since Prospector places item level holds, there are over 40 libraries in Prospector, and there are likely multiple holds for popular items. One suggestion is to place multiple holds on the same item or other copies of the item.
