Cataloging

What controls the display of records in Prospector?

The contribution or display of records in the INN-Reach catalog is controlled by suppression codes in the fixed length fields of local records. These must be coded by your library to determine contribution and display in Prospector. Your library can specify which fixed-length fields are used to control contribution and suppression to INN-Reach for each record type. The default (preferred) fields used for controlling each record type is BCODE3 (bibliographic records), ICODE2 (item records), CODE4 (order records), SCODE2 (checkin records). Contact III if you would like to create a new contribution code in Prospector.
