General

How is patron data loaded into Prospector?
Patron data is not loaded into Prospector. Bibliographic records, attached items, order and checkin records are contributed based on what the local library settings. When the patron is making a request in Prospector, the INN-Reach Circ program communicates to the local library server through port 443 to validate patron data (e.g. name, barcode, home library) against circ parameter tables, (e.g. Patron Type, Patron Blocks) to determine if the patron has borrowing privileges. Patron data remains in local system only.
